Quicksand 10/17/2010

There was a time when almost every action movie seemed to involve the hero or villain becoming swamped in quicksand, sinking away until only their hat remains on the surface; even Flash Gordon and vine-swinging ape-man Tarzan were victims during their careers.

Quicksand: impossible to escape from, but at the same time impossible to drown in. But contrary to what Hollywood would have you believe, it's actually impossible to drown in quicksand, but almost as impossible to escape, as a Dutch scientist found when he produced his own home-made variety in the laboratory.

Analysis of the composition of the "quicksand" showed that there are four key ingredients - sand, obviously, water, clay and salt. Together these materials form a structure resembling a house of cards, with large water-filled gaps between the sand particles, which are loosely glued in place by the clay.

As long as it's left alone, the structure remains stable. But as soon as it's disturbed, by stepping on it, the clay changes from a jelly-like consistency to a runny liquid. The effect is the same as stirring a pot of yoghurt. Liquefying the clay makes the quicksand about one million times runnier, and the whole house of cards comes tumbling down, with you inside it.

Very quickly, the sand sinks to the bottom and the water floats to the top. This is where the salt comes in. When there's enough salt present, as soon as the
